

THINGS YOU SHOULD KNOW ABOUT ATOPIC DERMATITIS (ECZEMA)

What is atopic dermatitis (eczema)?

- A chronic skin disease that causes dry, irritated skin.
- The cause is unknown, but it is believed to run in families.
- Occurs most often in babies and children, but can appear at any age.
- Is not contagious.
- Allergens like dust mites, mold, pollen, or pet dander.
- Eating certain foods, such as fish, soy, wheat, milk, or peanuts.
- Skin infections.
- Long, hot baths or showers or anything else that dries the skin.

What are the symptoms?

- An itchy rash, which appears most commonly on the face, hands and feet, behind the knees, and inside the elbows.
- Scratching may cause redness, swelling, scaling, and cracked, crusting, thick skin.
- Symptoms tend to come and go, worsening sometimes and improving or clearing up other times.
- People with atopic dermatitis (eczema) are more likely to have asthma and allergies, such as hay fever.

What factors can worsen atopic dermatitis (eczema)?

- Irritants, like wool, soap, perfume, chlorine, or smoke.

How is it treated?

- Practice a skin care routine to keep skin well-moisturized.
- Avoid things that lead to flares, such as allergens or irritants.
- Follow your doctor's advice for using skin creams or ointments to control swelling and reduce allergic reactions.
- Take antibiotics as directed for any infection related to the skin disorder.
- Antihistamines may reduce nighttime scratching.
- Light therapy, sometimes combined with a drug called psoralen, may reduce symptoms.
- Consult a specialist before getting the the smallpox vaccine because it can cause serious problems.
